HELICAL FOUNDATIONS FOR YOUR TELECOM STRUCTURES

Helical Tower Foundation Distributors is the Worldwide A.B. Chance Telecommunications Distributor. We offer alternatives to the traditional foundations for the Telecom Structures such as dead-men anchors, drill shafts, driven piles, etc using helical anchors. “Concrete-less” Foundations are now possible for Telecom Structures with the use of helical anchors. Helical Anchors allow overloaded towers to be augmented relatively easily to handle additional carriers.

“Concrete-less” Foundations

“Concrete-less” Helical Foundations are innovative alternatives for sites where concrete can not be used due to location, availability, etc. “Concrete-less” Helical Foundations offer sites where soil conditions are too poor to cost efficiently use other alternatives such as drill shafts or driven piles. Immediately apply loads without having to wait for the start /stop delays associated with formed concrete. There are no excavation spoils allowing wetlands to be developed as tower sites without the need of Wetland Mitigation Banking.

Augmentations

Augmentations are made readily available to tower sites with the use of helical anchors. Helical anchors can add greater capacity in smaller areas allowing much smaller and more versatile pile caps. Helical anchors allow existing tower sites easier access than other deep foundation alternatives such as drill shafts or pile drivers.
